

BINMAXX SCALE

BinMaxx is a weighing system used specifically for front end loaders. BinMaxx identifies non-profitable accounts and compares revenue to disposal costs on a customer-by-customer basis to increase profitability.

Bin weight can be printed either using the optional in-cab printer or transmitting the information to a third party on-board computer for route management system data collection and analysis.

BinMaxx uses two sensors--one for each arm. These deflection sensors are held by brackets and measure the weight of the bins placed on the truck's lift arms. Arm-mounted sensors are far more durable than those mounted on the forks, and will remain calibrated for a much longer period of time.

Features & Benefits

- Ability to weigh individual containers
- Integrates with on-board computers
- Accurate weights over temps from -40 degrees F to 185 degrees F
- Stores up to 1,000 lifts

Applications

Front End Loader Garbage Trucks.
